About Me

I'm a paid social and performance marketing lead with 10+ years at the intersection of data, platforms, and global audience growth.

At Disney Streaming, I own paid social and SEM strategy across APAC and Domestic (US/CA) markets, managing always-on and tentpole campaigns across Meta, TikTok, Snapchat, YouTube, and Search while running a testing roadmap that has produced global BAU changes. I also provide cross-functional support across LATAM and EMEA.

Across my career I've managed budgets from \$5K/month to over \$100M annually. The scale has never changed the approach.

Case Study 01

TikTok Audience Architecture Overhaul — AUNZ

How restructuring TikTok's targeting model drove a 31% CPA improvement on a flagship title — and became global BAU.

Market

Australia / NZ

Platform

TikTok

Duration

Mar – Oct 2024

Type

Structural Pilot

The Problem

TikTok BAU relied on broad A18+ audiences — the same open-targeting approach that worked on Meta and Snapchat. On TikTok, that model was underperforming. The hypothesis: TikTok's algorithm responds better to interest-based signals than pure open targeting.

The Approach

- Ran title-matched interest audiences (Taylor Swift, Star Wars, Sci-Fi, Drama) head-to-head vs. BAU broad targeting
- Tested across 4 titles + a Blockbuster period to avoid single-title bias
- Maintained equal spend splits for clean comparison
- Rolled winning structure into BAU across the full AUNZ market

Key Results

31%

CPA improvement

Taylor Swift: \$35 → \$24 CPA

3.6x

More sign-ups

Taylor: 1,178 BAU vs 4,228 refined

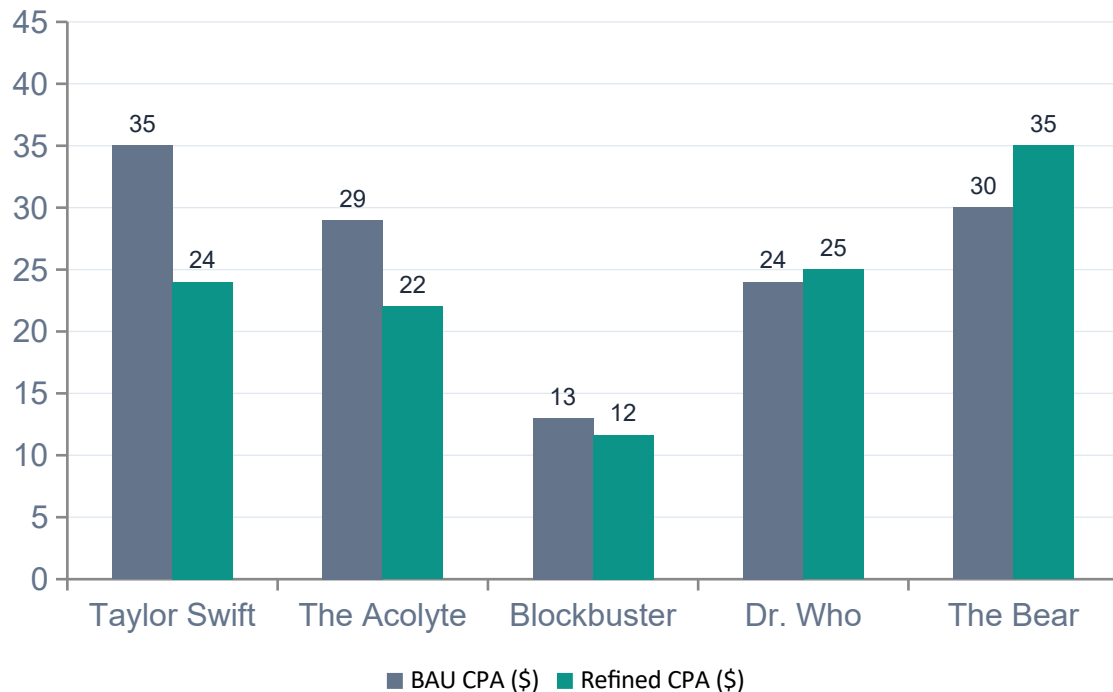

\$11.65

CPA, Blockbuster peak

Disney audience; Gen Ent \$12.70, BAU \$13.01 — all close

Note: BAU won on Doctor Who and The Bear — results were title-dependent, not universal. Refined audiences became BAU where they outperformed.

CPA by Title: BAU vs. Refined Audience

Takeaways

Refined won on 3 of 5 titles with meaningful CPA improvement

BAU held its own on Dr. Who and The Bear — results context-dependent

Refined structure rolled out as AUNZ TikTok BAU following test conclusion

Case Study 02

Meta Dynamic Text: Smaller Markets, Bigger Impact

Testing whether Meta's dynamic primary text could outperform static copy in TW, HK, and SG — and rolling a regional win globally.

Markets

TW · HK · SG

Platform

Meta

Duration

Jul – Aug 2024

Type

Creative A/B Test

Context & Approach

After Dynamic Primary Text outperformed static copy in AUNZ, the test was replicated in the smaller TW, HK, and SG markets. The hypothesis: Meta's dynamic text would optimize toward the best-performing copy variation, lowering CPA even at reduced spend levels. Static text was expected to scale higher due to more creative units running simultaneously.

Methodology

- 3 static text variations vs. dynamic text unit across all three markets
- Held creative and bid strategy constant to isolate text variable
- Evaluated on CPA efficiency and sign-up volume simultaneously
- Dynamic won on CPA in 2 of 3 markets; static scaled higher in volume — both findings informed the BAU decision

Results by Market

Taiwan (TW)

Static: \$31.80 → Dynamic: \$25.26

21% better CPA

Hong Kong (HK)

Static: \$45.54 → Dynamic: \$41.24

9% better CPA

Singapore (SG)

Static: \$29.04 → Dynamic: \$34.21

BAU won (low spend)

**Outcome: Dynamic won on CPA efficiency; static scaled more volume.
Decision: dynamic adopted as global Meta BAU for cluster-level efficiency.**

Case Study 03

XChannel Fluidity: One Cluster, Better Results

Consolidating TW, HK & SG into a single fluid campaign structure —
9% more efficient, 10% more volume, 30%+ operational savings.

Markets

TW · HK · SG

Channels

Meta · Display
(Yahoo/DV360)

Duration

FY25 (multi-round)

Confidence

Gold Level Learning

The Idea

Instead of running separate campaigns per market, consolidate TW, HK, and SG into a single clustered structure and let the algorithm allocate spend fluidly toward the best-performing market at any given time. The hypothesis: algorithmic flexibility would outperform manual market splits on both efficiency and volume.

How it played out

- Round 1 (Silver): Positive signal on performance, operational gains confirmed
- Round 2 (Gold, >99% win probability): 8% more efficient CPA, 6% more sign-ups vs. control
- Spend naturally prioritized TW without cannibalizing HK/SG due to min budget caps
- Rolled out across Meta Social, TikTok (TW/SG), and Display — recommended for Snap

Gold Learning Results

8%

More efficient CPA

Fluidity \$23.51 vs. Control \$25.37

6%

More sign-ups

5,431 Fluidity vs. 5,116 Control

30%+

Operational time saved

Simplified trafficking across DAV & Meta

Program-level impact: across \$10M+ in annual spend, fluidity structure estimated to generate ~29K additional sign-ups at \$32 vs. \$35 CPA.

Platform Spotlight

First-Mover Bets on TikTok

Two pilots. Two decisive wins. Both now global BAU.
